

(Optional) OLS Properties

Name: Jikhan Jeong

March 3, 2022

1. Positive Definite, Trace, Idempotent, Inverse, Matrix Derivative

1.1 Positive Definite

- $X'X$ = Square Matrix = Positive Definite = Convex = Can be minimized
- In OLS assumptions, we requires $(X'X)^{-1} \rightarrow 0$ to derive consistency of $\text{Cov}(\beta)$

1.2 Trace

- (Example) $\text{Trace} \begin{bmatrix} x_{11} & x_{12} & x_{13} \\ x_{21} & x_{22} & x_{23} \\ x_{31} & x_{32} & x_{33} \end{bmatrix} = \sum_{i=1}^3 x_{ii} = x_{11} + x_{22} + x_{33}$
- $\text{Trace}(\text{scalar} \times X) = \text{scalar} \times \text{Trace}(X)$
- $\text{Trace}(X+Z) = \text{Trace}(X) + \text{Trace}(Z)$
- $\text{Trace}(X') = \text{Trace}(X)$
- $\text{Trace}(AB) = \text{Trace}(BA)$
- We need it when $\text{Cov}(Y) = \sigma^2 I = \text{Cov}(\varepsilon) = E(\varepsilon\varepsilon')$, where $E[\text{Trace}(e'Me)] = \text{Trace}[M]E(e'e) = (n-k)E(e'e)$, where n = sample number, k = variable numbers = column $\dim(X)$

1.3 Idempotent Matrix

- We need it when $\text{Cov}(Y) = \sigma^2 I = \text{Cov}(\varepsilon) = E(\varepsilon\varepsilon')$, where $E[\text{Trace}(e'M'Me)] = E[\text{Trace}(e'Me)]$
- $P \subset \text{Idempotent Matrix}$, then $P'P = P$
- $P \subset \text{Idempotent Matrix}$, then $I - P = M$, $M \subset \text{Idempotent Matrix}$

1.4 Inverse Matrix

- $A = (A^{-1})^{-1}$
- $(A')^{-1} = (A^{-1})'$
- $(AB)^{-1} = B^{-1}A^{-1}$
- $|A^{-1}| = \frac{1}{|A|}$

1.5 Matrix Derivative

- From Prof. Ron's Book p.440, Useful for OLS Loss minimization
- \mathbf{z} : (k x 1) vector, \mathbf{A} : (k x j) matrix, \mathbf{w} : (j x 1) vector
- $\frac{\partial \mathbf{z}' \mathbf{A} \mathbf{w}}{\partial \mathbf{z}} = \mathbf{A} \mathbf{w}$
- $\frac{\partial \mathbf{z}' \mathbf{A} \mathbf{w}}{\partial \mathbf{w}} = \mathbf{A}' \mathbf{z}$
- $\frac{\partial \mathbf{z}' \mathbf{A} \mathbf{z}}{\partial \mathbf{z}} = 2 \mathbf{A} \mathbf{z}$, where k=j and A is a symmetric ($\mathbf{A}' = \mathbf{A}$)
- $\frac{\partial \mathbf{z}' \mathbf{w}}{\partial \mathbf{z}} = \mathbf{w}$, (k=j)
- $\frac{\partial \mathbf{z}' \mathbf{w}}{\partial \mathbf{w}} = \mathbf{z}$, (k=j)

2. Summarize the classical assumptions of GLM

- $E(Y) = \mathbf{x}\beta$ and $E(\varepsilon) = 0$
- $\text{Cov}(Y) = \sigma^2 I = \text{Cov}(\varepsilon) = E(\varepsilon \varepsilon')$
- \mathbf{x} is a fixed matrix of values with $\text{rank}(\mathbf{x}) = k$, where k = unknown parameters

3. OLS objective function

- $S = \mathbf{e}'\mathbf{e}$, OLS minimize S
- $S = \mathbf{e}'\mathbf{e} = (\mathbf{y} - \mathbf{x}\beta)'(\mathbf{y} - \mathbf{x}\beta)$
- FOC β : $-2\mathbf{X}'\mathbf{y} + 2\mathbf{X}'\mathbf{X}\hat{\beta} = 0 \mapsto \mathbf{X}'\mathbf{y} = \mathbf{X}'\mathbf{X}\hat{\beta} \mapsto (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y} = \hat{\beta}$
- SOC β : $2\mathbf{X}'\mathbf{X}$ is a positive definite

4. Gauss-Markov

- $\hat{\beta}$ in OLS is unbiased and efficient within the class of linear, unbiased estimator (BLUE)
- $\hat{\beta} = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y} = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'(\mathbf{X}\beta + \mathbf{e}) = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{X}\beta + (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{e}$
 $= \beta + (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{e}$
- $E(\hat{\beta}) = E(\beta + (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{e}) = \beta + 0 = \beta$, unbiased
- $\text{Cov}(\hat{\beta}) = E[(\hat{\beta} - E(\hat{\beta}))(\hat{\beta} - E(\hat{\beta}))'] = E[(\hat{\beta} - \beta)(\hat{\beta} - \beta)'] = E[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{e}\mathbf{e}'\mathbf{X}(\mathbf{X}'\mathbf{X})^{-1}]$
 $= (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'E(\mathbf{e}\mathbf{e}')\mathbf{X}(\mathbf{X}'\mathbf{X})^{-1}$, where $E(\mathbf{e}\mathbf{e}') = \sigma^2 I$
 $= \sigma^2(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{X}(\mathbf{X}'\mathbf{X})^{-1} = \sigma^2(\mathbf{X}'\mathbf{X})^{-1}$
- $\text{Cov}(Y) = E(\hat{\varepsilon}'\hat{\varepsilon}) = E[(Y - \hat{\beta}\mathbf{X})(Y - \hat{\beta}\mathbf{X})'] = E[(Y - \hat{\beta}\mathbf{X})(Y - \hat{\beta}\mathbf{X})'] = E[\mathbf{e}'\mathbf{M}\mathbf{M}\mathbf{e}] = E[\mathbf{e}'\mathbf{M}\mathbf{e}]$
- $= E[\text{Tr}(\mathbf{e}'\mathbf{M}\mathbf{e})] = E[\text{Tr}(\mathbf{M}\mathbf{e}\mathbf{e}')] = \text{Tr}(\mathbf{M})E(\mathbf{e}'\mathbf{e}) = \text{Tr}(\mathbf{I} - \mathbf{P})\sigma^2 = (n - k)\sigma^2$
- $\frac{\hat{\varepsilon}'\hat{\varepsilon}}{n - k} = s^2$, sample variance to make it unbiased estimator of $\sigma^2 \mapsto E(\frac{\hat{\varepsilon}'\hat{\varepsilon}}{n - k}) = E(s^2) = \sigma^2$

4.1 (Proof $E[e'Me] = \sigma^2 \text{Tr}(M)$, Econometrics(Hayashi, p31))

- $e'Me = \sum_{i=1}^n \sum_{j=1}^n m_{ij} \varepsilon_i \varepsilon_j$, derivation of quadratic form
- $E(e'Me|X) = \sum_{i=1}^n \sum_{j=1}^n m_{ij} E(\varepsilon_i \varepsilon_j | X)$, where $E(m\varepsilon_i \varepsilon_j | X) = m_{ij} E(\varepsilon_i \varepsilon_j | X)$ as m_{ij} is function of X
 $= \sigma^2 \sum_{i=1}^n m_{ii}$, as the classical assumptions of OLS $= \sigma^2 I = \text{Cov}(\varepsilon) = E(\varepsilon \varepsilon')$
 $= \sigma^2 \cdot \text{Trace}(M)$

5. Consistent estimator of θ

- If $\hat{\theta}$ converges in probability to θ , then we say it is a consistent estimator
- $\text{plim } \hat{\beta} \rightarrow \beta$, consistent estimator as follows:
 $\text{plim } \hat{\beta} = \beta + \text{plim}(X'X)^{-1}X'e = \beta + \text{plim}(X'X_n)^{-1}X'e = \beta + \text{plim}(X'X_n)^{-1} \frac{X'e}{n}$
 $= \beta + \text{plim}(X'X_n)^{-1} \cdot 0 = \beta$
- $\text{plim } s^2 = \frac{\hat{e}'\hat{e}}{n-k} \rightarrow \sigma^2$, consistent estimator as follows:
 $s^2 = \frac{\hat{e}'\hat{e}}{n-k} = \frac{e'Me}{n-k} = \frac{e'(I-P)e}{n-k} = \frac{e'e - e'X(X'X)^{-1}X'e}{n-k} = \frac{e'e}{n-k} - \frac{e'X(X'X)^{-1}X'e}{n-k}$
 $\text{plim } s^2 \rightarrow \text{plim}(\frac{e'e}{n-k}) - \text{plim}(\frac{e'X(X'X)^{-1}X'e}{n-k}) \rightarrow \sigma^2 - \text{plim}(\frac{e'X(X'X)^{-1}X'e}{n-k})$
 $\rightarrow \sigma^2$, where $\text{plim}(\frac{e'X(X'X)^{-1}X'e}{n-k}) = 0$ as $\frac{(X'X)^{-1}}{n} \rightarrow 0$

6. R^2

- Simple regression case, 1 exogenous variable“
- R^2 measures the percentage of variations in \hat{Y} can be explained by the regression model
- $\text{SST} = \text{total sum of squares} = (Y - \bar{Y})(Y - \bar{Y})'$
- $\text{SSE} = \text{error sum of squares} = (Y - \hat{Y})(Y - \hat{Y})'$
- $\text{SSR} = \text{sum of square residuals} = \text{SST} - \text{SSE} = (\hat{Y} - \bar{Y})(\hat{Y} - \bar{Y})'$
- $R^2 = \frac{\text{SSR}}{\text{SST}} = \frac{\text{SST} - \text{SSE}}{\text{SST}} = 1 - \frac{\text{SSE}}{\text{SST}}$
